DSL Diagnostic Tools Designed for the Modern Network

Today there are more than 300 million DSL subscribers worldwide—far more than fiber, fixed wireless, and cable combined—and that number continues to grow. In this era of hyper-connectivity, DSL technology has become much more than simply a way to access the Internet. Subscribers expect a high-performance, highly reliable network, and for service providers to deliver they need advanced troubleshooting capabilities that help ensure a minimal mean time to repair (MTTR) and give them a strong competitive edge.

Traditional testing approaches have typically evolved from hardware-based, vendor-centric plain old telephone service diagnostics tools. Since these were not designed with DSL testing in mind, many service providers find that they lack the required functionality and ultimately prove inadequate (see Figure 1).

The award-winning ASSIA® DSL Expresse® Performance Evaluation module delivers state-of-the-art DSL diagnostic tools designed to support a modern network. This hardware-agnostic solution is entirely software based, automatically collecting operational and performance data and converting them into graphical reports that accurately detail:

- Discovered faults
- Fault location when relevant

Reduce Your DSL Test and Network Maintenance Expenses

The ASSIA DSL Expresse solution provides a user-friendly interface with easy, Web-based remote access to the rich set of diagnostic tools for all technicians. This helps eliminate the need to invest in expensive hardware probes or test sets, multiple training sessions, and prohibitive hardware maintenance contracts. As a result, service providers have reported savings in excess of $100 million, depending on the size of the network and maintenance crews.

Since ASSIA DSL Expresse Performance Evaluation is non-disruptive, diagnostics can be performed at any time without having to interrupt the customer’s service.

Furthermore, the tool is available to your entire technical staff for the same cost; you do not have to perform challenging tradeoffs between customer satisfaction and network diagnostics expenses.
Increase Dispatch Efficiency and Reduce Costs

ASSIA DSL Expresse locates faults and recommends corrective action so technicians can resolve any issues quickly and efficiently. This can help reduce the number of repeat dispatches by up to 50 percent. Leveraging a dispatch recommendation from the ASSIA DSL Expresse Performance Evaluation module helps service providers improve dispatch efficiency. For instance, one service provider reported efficiency increases of 39 percent when considering the percentage of DSL issues fixed after dispatch. This reduced the useful dispatch cost by as much as 30 percent in this case (see Figure 2).

The historical information stored in the ASSIA DSL Expresse database includes identifying varying trends in time and weather, allowing for highly effective troubleshooting, even when faults appear to be random in nature.

In addition, the proactive dispatch report also included in the Performance Evaluation module lets dispatchers optimize the routes and timing of repair teams by proactively addressing issues with the copper plant near a prior intervention.

Real-time Analysis Helps Ensure World-class Customer Satisfaction

ASSIA DSL Expresse includes an additional licensing option known as Real-Time Analysis for the Performance Evaluation module.

This capability can easily be accessed by the field technician while on dispatch, and confirms in real time that the problem has actually been fixed and that DSL performance is restored or enhanced. The result is an improvement in technician performance in the field and a reduction in the number of repeat calls and dispatches.

Real-time Performance Evaluation allows field technicians and contact-center agents to inspect a line closely by requesting additional data collection with a configurable schedule. If supported by the corresponding DSLAM, they can further examine the traffic volumes for a specified broadband connection in real-time.

The real-time diagnostics in the ASSIA DSL Expresse Performance Evaluation module provide expert DSL technicians with access to highly advanced DSL performance data (see Figure 3), including per-tone data for all types of access supported by ASSIA DSL Expresse. This lets technicians perform their own analysis and fine tune the diagnostics results from ASSIA DSL Expresse.
